

Let's test some variables from a Word document.

Ok, the variable "var1" might

- stand alone: \${var1}
- be prefixed: prefix\${var1}
- be postfixed: \${var1}postfix
- or be infix: in\${var1}fix

Likewise, the variable "var 2" might

- stand alone: \${var 2}
- be prefixed: prefix\${var 2}
- be postfixed: \${var 2}postfix
- or be infix: in\${var 2}fix

But it might also be split across lines in all variants:

- stand alone: \${var
2}
- prefixed: prefix\${var
2}
- postfixed: \${var
2}postfix
- or infix: in\${var
2}fix

Let's see what can be recognized.
